                                                                                                                                                                                      isolation of the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hESP (in standard blotting, amplification or immuno assays), particularly for diagnosis of digestive, non-immuno edfensive, endocrine or immuno system disorders. A particular application or immuno system disorders. A particular application is diagnosis of cancers of the salivary gland, thymus and application is diagnosis of cancers of the salivary gland, thymus and agence and may be expressed in vivo from the DNA. The protein is expressing it, are used in screening tests to identify specific (ant) agonists, e.g. antibodies (Ab), polypeptides and antisense nucleic acids, which are potentially useful for treating conditions associated with excessive hPSP production. Cells containing the DNA are used to express the recombinant protein and this can be used to raise Ab, useful for diagnosis, thereby, for affinity purification and to identify

that bind specifically to, and modulate activity of HPSP). Antaqonists that bind specifically to, and modulate activity of HPSP are used to treat cancer and autoimmune discases particularly or secretory or gastrointestinal tissue, e.g. cancer of salivary giand, thyroid, prostate, breast, gastrointestinal tract or pancreas, Sjorgen's syndrome, claves disease, thyroiditis, insulin-dependent diabetes; pancreatitis, cortaining expression vectors comprising the HPSP nucleic acid are used to roduce recombinant HPSP which is used to generate antibodies and to screen for its antagonists. Antibodies are useful directly as antagonists, to transport drugs to HPSP-expressing cells, to detect cells that express HPSP, to monitor patients being treated with HPSP, and for purification of HPSP from natural sources. Expression of HPSP may indicate cell proliferation. HPSP nucleic acid or its fragments are used to detect HPSP-encoding sequences (optionally after amplification by PCR) by hybridisation, particularly for diagnosis and monitoring of disease, but also for mapping the chromosomal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; tumour; diagnosis; neoplastic disease; neoplastic cell growth; proliferation; tumourigenesis; identification; cancer; cytostatic; nootropic; neuroprotective: antiinflammatory; immunosuppressive; immunostlmulant; antiangiogenic; leukaemia; lymphoid malignancy;

   The present invention describes an isolated antibody that binds to one of the human PRO proteins designated PRO212, PRO290, PRO341, PRO535, PRO6199, PRO199, PRO810, PRO6194, PRO190, PRO1090, PRO1019, PRO1050, PRO1030, PRO1097, PRO1111, PRO1153, PRO1182, PRO1184, PRO1187, PRO2198, PRO2199, PRO834, PRO1317, PRO1151, PRO2199, PRO2199, PRO2199, PRO834, PRO1317, PRO1110, PRO2199, PRO2199, PRO2199, PRO8191, PRO101917, PRO1111, PRO1151, PRO1161, LUMOUR Cell growth. The PRO POLIPHETICS can be used to inhibit tumour cell treatment, diagnosis and prevention of cancer. The antibodies and other anti-tumour compounds maybe used to treat various conditions, including
                                                                                                                                                                                                                                                                              those characterised by overexpression and/or activation of the amplified PRO genes. Exemplary conditions or disorders to be treated with such antibodies and other compounds include benign or malignant tumours (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian,
                                                                                                                                                                                                                                                                                                                                      colorectal, prostate, pancratic, lung, vulva, thyroid, hepatic carcinomas, sarcomas, glioblastomas, and various head and neck tumours), leukemias and lymphoid maliganches, other disorders such as neuronal, glial, astrocytal, hypothalamic and other glandular, macrophagal, epithelial, stromal and blastocoelic disorders, and inflammatory, angiogenic and immunologic disorders. AAC$8242 to AAC$836 represent PCR primers and hybridisation probes used in the isolation of the human PRO sequences. AAC$8357 to AAC$8357 to AAC$84089 represent human PRO polynucleotide and protein sequences given in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chromosome mapping; cancer; autoimmune disease; cardiovascular disorder; cystic fibrosis; hypothyroidism; immunological disorder; amyloidosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             brain disorder; skeletal muscle disorder; eye disorder; obesity; mitochondriocytopathy; diabetes; atherosclerosis; Alzheimer's disease; neurodegenerative disorder; graft rejection; dementia; hyperlipidaemia;

therapy and chromosome mapping procedures and may be used to design expression vectors and secretion vectors. The proteins of the invention may be used to treat diseases including cancer, autoimmune diseases, cardiovascular disorders, cystic fibrosis, hypothyroidism, immunological disorders, obesity, mitochondriocytopathies, diabetes, atherosclerosis, neurodegenerative disorders, graft rejection, Alzheimer's disease, dementia, hyperlipidaemia, septic shock and impotence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a human secreted protein amino acid sequence. The invention relates to sequences AAA8725-A8774 which encode human secreted proteins AAB25763-B25812. The proteins include signal peptides. Included in the invention are a host cell containing one of the cDNA sequences, and a purified antibody capable of binding to one of the sequences, and a purified antibody capable of binding to one of the sequence data on a computer system, and a method for identifying features of the CDNA sequences using a computer programme. The CDNAs are useful for expressing secreted proteins or fragments to obtain antibodies capable of specifically binding to the secreted proteins. The CDNAS may also be useful in diagnostic, forensic, gene
                                                                                                                                                                                                                                                        Polynucleotides and polypeptides encoding proteins with signal peptides, useful in diagnostic, forensic, gene therapy and chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Equine influenza virus; ei; cold adaptation; temperature sensitivity; vaccine; neiwtlNP-C-679 DNA; PeiwtlNP-C-225 protein.
                                                                                                                                                                                                                                                                                                    Gaps
     The patent discloses coid-adapted equine influenza viruses and reassortant influenza A viruses comprising atleast one genome segment of such an equine influenza virus, wherein the equine influenza virus genome segment confers atleast one identifying phenotype of the cold-adapted equine influenza virus, such as cold adaptation, temperature sensitivity, dominant interference or attenuation. The viruses are useful for protecting animals from diseases caused by influenza viruses. They are also used as vaccines. The present sequence is equine influenza (ei) virus hans beintl (whild type) NP-C-217 protein which is encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             reassortant influenza A viruses comprising atleast one genome segment of such an equine influenza virus, wherein the equine influenza virus genome segment confers atleast one identifying phenotype of the cold-adapted equine influenza virus, such as

The pathogens are especially selected from Anjeskyl's disease virus, swine influence virus (SIV), portine respiratory and reproductive syndrome virus (PRRSV), hog cholera virus (HCV) and Actinobacillus pleuropneumoniae. The vaccines are preferably composed of polynucleotide sequences encoding 3 antigens, all as part of vectors. This sequence represents the SIV strain HINI nucleoprotein. The coding sequence was subcloned into the plasmid pVRIO12 to generate plasmid pPB142 for use in the vaccine.
                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Multi-valent polynucleotide varcines against porcine pathogens - consist of at least 3 plasmids able to express protective antigens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a multivalent vaccine for protecting pigs
cold adaptation, temperature sensitivity, dominant interference or attenuation. The viruses are useful for protecting animals from diseases caused by influenza viruses. They are also used as vaccines. The present sequence is equine influenza (ei) virus neiwtlnP-C-679 DNA.

The present sequence represents a protein from a Swinepox virus strain

Kasza isolate S-SPV-001 HindIII M fragment DNA fragment, which is used in
an example from the present invention. The present invention specifically
describes recombinant swinepox virus (SPV) comprising a foreign DNA (I)
inserted into a SPV genome which is capable of being expressed in a host
cell into Which the virus is introduced, where (I) is inserted into: (a)
an ECORI site within a region corresponding to a 3.2 kb subfragment of
the HindIII K fragment which contains both a HindIII and an ECORI site,
of the SPV genome, and optionally (b) an AccI site within a region
corresponding to a 3.6 kb HindIII to Bgl11 subfragment of the HindIII M
fragment. The recombinant SPV can be used in a vaccine for immunising an
animal against SPV. The invention also provides a method for testing a
corresponding particularly containing S-SPV-008, or is infected with the
vaccine, particularly containing S-SPV-008, or is infected with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        recombinant SPV can be used in a diagnostic assay, e.g. Feline immunodeficiency virus (FIV) env and gag genes and birofilaria immitis p39 and 22kd are useful to detect feline immunodeficiency caused by FIV and to detect heartworm caused by D. immitis respectively.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        against several pathogens, especially pathogens associated with respiratory and digestive diseases. The pathogens are especially selected from Anjeszky's disease virus, swine influence virus (SIV), portine respiratory and reproductive syndrome virus (PRBSV), hog cholera virus (HCV) and Actinobacillus pleuropneumoniae. The vaccines are preferably composed of polynucleotide sequences encoding 3 antigens, all as part of vectors. This sequence represents the SIV strain H3N2 nucleoprotein. The coding sequence was subcloned into the plasmid pVRIO12 to generate plasmid pPB132 for use in the vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                   nucleoprocein gene (NP) cloned into the EcoRI site of pBR322.

A fragment containing the NP gene was obtained from the plasmid by PCR with primers that added a SacII site adjacent the Arg codon of NP, and the last 5 amino acids of PE followed by a termination codon and an EcoRI site to the 3' end of NP. The PCR fragment was digested with SacII and EcoRI and ligated to SacII/EcoRI-digested plasmid pVC-PEMI-2 (encoding a Pseudomonas exotoxin-influenza A virus MI matrix protein fusion). In the resulting plasmid, pVC-PENPcSaa, the binding and translocation domains of PE are fused

Example 25 describes the construction of pvC-PENPcSaa. A fragment contg. the nucleoprotein (NP) of Influenza A virus was obtained from plasmid pApr501. PApr501 is the nucleoprotein gene cloned into the EcoRI site of pR8222, by PCR with oligonucleotide primers which added a SacII site adjacent to the ATG codon of NP to give the sequence of AAQ38409, and the last 5 amino acids of PR followed by a termination codon and an EcoRI site to the 3' end of NP to give the sequence shown in AAQ38410. The PCR fragment was digested with SacII and EcoRI. The resulting plasmid pvC-PEMI-2 digested with SacII and EcoRI. The resulting plasmid is named pvC-PENPCSEAB. The S' and 3' ends of the PRNPSaa insert (AAQ38411) were verified by sequencing. This construction fuses the binding and translocation domains of PE to the Influenza A nucleoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Escherichia coli; E. coli; proliferation; inhibition; screening; antimicrobial; bacterial growth; antisense therapy; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bacterial toxin-antigen protein conjugates - to elicit cytotoxic T-lymphocyte immune response, used for preventing viral infections, e.g. by influenza virus, HIV and human papilloma:virus

                                                                                                                                                                                                                                                                                                        identify a proliferation- required gene in a microorganism, by contacting a microorganism with a proliferation-required gene activity inhibitory nucleic acid identified in another organism, and determining if inhibition occurs in the second microorganism. The nucleic acid sequences identified as being required for bacterial growth and proliferation, can be used for antisense therapy for killing bacteria.
                                                                                                                                                                                                            AAA65809 to AAA65889 and AAA66058 to AAA66138 represent nucleotide sequences derived from Escherichia coli which inhibit E. coli proliferation. AAA66890 to AAA66055 and AAB16886 to AAB168040 represent nucleotide and protein sequences associated with E. coli proliferation. AAA666055 and AAA66057 represent primers used for sequencing E. coli proliferation inhibiting nucleotide inserts in an example from the present invention. Methods from the present invention can be used to

                                                         The present sequence represents a Pseudomonas aeruginosa polypeptide sequence. P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a P. aeruginosa infection.
                                                                                                                                                                                                                                                                                                                                                                                 note: the sequences given in the specification were poorly legible, and in some instances assumptions were made as to the identity of the residue; it is therefore possible that the sequence given below is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 229,

IT IS ESSENTIAL FOR DNA REPLICATION AND REPAIR OF DAMAGED DNA (BY SIMILARITY)

CATALYTIC ACTIVITY: NAD(+) + (deoxyribonucleotide)(N) + (deoxyribonucleotide)(M) = AMP + nicotinamide nucleotide)(A+M).

DF RNA-directed RNA polymerase (EC 27.7.48) (183 kDa protein) [Contains: DE RNA-directed NNA helicase (MT/HEL) (126 kDa protein)].

DE Methyltransferase/RNA helicase (MT/HEL) (126 kDa protein)].

OS Tomato mosaic virus (strain L) (Towy) (Twy strain tomato).

Viruses: ssRNA positive-strand viruses, no DNA stage: Tobamovirus.
